

SortMeOut

AI-Powered Desktop Automation for macOS

v1.0.1 — Created by Said Borna

WHAT IT DOES

SortMeOut is a native macOS desktop application that combines intelligent file automation with a full-spectrum AI assistant. It watches folders in real-time and organizes files the moment they appear — matching against user-defined rules with 17 condition types and 22 action types. Beyond file management, the built-in AI assistant powered by Claude acts as a complete desktop companion: it executes 31 system commands spanning file operations, Spotlight search, Finder tags, email, calendar, contacts, presentations, system control, and more — all from natural language. An integrated Image Studio powered by DALL-E 3 adds on-device image generation, editing, and conversion. The entire experience lives in the macOS menu bar as a single, always-available app.

THE VISION

The Mac ecosystem lacks a unified automation layer that thinks for you. Existing tools handle one thing — file sorting, or scripting, or AI chat — but none combine them into a single intelligent surface that understands your desktop, your schedule, your files, and your intent. SortMeOut is being built to become that surface: a personal operations layer for macOS that replaces five separate utilities with one AI-native application. The ambition is a product that competes directly with established players like Hazel, Raycast, and Alfred — but goes further by integrating deep Apple ecosystem access with conversational AI that can actually execute.

WHY IT EXISTS

Power users and professionals on macOS still manage their digital workspace manually. Files pile up, workflows stay fragmented, and system-level tasks require jumping between apps, terminals, and settings panels. AI assistants exist, but they answer questions — they don't act. SortMeOut was built for the gap between knowing what needs to happen and having it happen automatically: real automation, real execution, real integration with the operating system.

CURRENT STATE

SortMeOut is in active development with a functional product already built and running. The rule engine, AI assistant, Image Studio, and all macOS integrations are operational and validated by 301 automated tests. The application ships as a standalone .app bundle. Development is ongoing with a clear roadmap toward a polished, market-ready release — focused on first-run experience, persistent AI conversations, and expanded Apple ecosystem depth. This is not a prototype; it is an early-stage product being built to enterprise-grade quality with the ambition to compete at scale.
